

Migrate Blog to Octopress 3.0

After 4 days coding, finally get to migrate this blog to new [Octopress 3.0](#).

Octopress 3.0 is not just a upgraded version of Octopress 2.x. In 3.0, everything is separated into standalone gems, which can be used on any Jekyll site. Thus there will no longer be a division between Octopress and Jekyll.

The migrating process is a bit of suffering, because there is no official guide, and also I'm a newbie to the whole Ruby world. But on the other hand, I learned a lot, including both Ruby programming and open source project tools, such as [RubyGems](#) and [Travis CI](#).

In sum, I'm happy to extract the codes generating pdf files from `Rakefile` to a more appropriate [octopress ink plugin](#).

Another thing I impressed is the test framework, the idea is simply but powerful. I'm considering to write or find a test framework for my other C projects.

Update: I write a Bash script testing framework, which can be found in [here](#).
